MySQL

Amazon Web Services

Angular

Profile Summary

Full Stack Engineer with five years of commercial experience, most of it on high-traffic publishing sites where organic search is the business. At Glide Tech I owned client publishers' live websites — their React and Next.js front ends, the Node and AWS services behind them, and the Core Web Vitals work that kept them fast. Most recently backend, in Go and MySQL, on a platform serving 836,000 registered users.

Employment History

Backend Developer — Pickleball Inc

Apr 2025 — Sep 2026

- **Rebuilt the messaging platform** — multi-tenant infrastructure behind every email, SMS and push the product sends: 150,000 emails and 250,000 SMS a month, worldwide. Delivery sits behind a provider-agnostic adapter with customer-supplied provider accounts. Shut down an SMS pumping attack — fraudsters farming termination fees on high-cost destinations — with an allowed-destinations list, registration rate limiting and IP-to-phone geolocation matching.
- **Built plan management across affiliation hierarchies** — what happens when a parent organization takes over membership plans for its whole tree, on a system whose largest program runs 247 clubs under a single root. Every club's own plans switch off, active subscriptions run to the end of their period, and scheduled ones are cancelled before they ever charge.
- **Wired the billing paths** — a club joining or leaving a hierarchy never interrupts its members' payments: the plan is cloned locally and the same live Stripe subscription re-pointed at it. Reconciling every message against the carrier's final charge gave the business its first real numbers on what SMS costs, and routing now weighs cost, security and regulation together.

Software Engineer — Glide Tech

Jul 2021 — Jan 2025

- **Owned client publishers' live websites** — IFR (International Financing Review, LSEG's capital markets publication), MailPlus, PokerOrg and AltChar, one-to-one with each client, no account layer between. Server-rendered templates from the Glide Publishing Platform with React and Next.js front ends; raised PokerOrg from the ground up as its most senior engineer.
- **Took Core Web Vitals across the company** — my own sites first, then ten more once the numbers proved out. Article hero images prioritised with preload and fetchpriority. MailPlus: deferring render-blocking third-party scripts ended 29 consecutive months of failure — layout shift to zero on phone, tablet and desktop, first paint 3.5s to 2.3s. AltChar: code splitting and dependency cuts took the mobile home page from 2,044 requests to 63, JavaScript 1.6 MB to 268 KB.
- **Took over MailPlus's front end** — the Daily Mail's paid subscription product. Unprompted, moved filter state into the URL so filtered pages stayed shareable without a page reload. Gave product owners behavioural analytics — scroll on both axes, hover, navigation — instrumented into Mixpanel.
- **Backend and search infrastructure** — IFR's scheduled XML export of each new issue to subscribers, on Lambda, DynamoDB and cron. PokerOrg's live-reporting feed to the World Series of Poker, rendered on wsop.com. XML sitemaps generated from CMS content, and schema markup earning rich snippets on every project.

Internship & Education

Intern Developer — Cape Ann Enterprises

Nov 2020 — Apr 2021

- **MEAN Stack** — Built a performance-management application in MongoDB, Express, Angular and Node.js.

Bachelor's Degree — IPI Academy

Sep 2018 — Mar 2022

- Information Technology, completed while working full time — the Cape Ann placement ran inside the degree, and the degree's final months overlapped my first at Glide.
